

ImageMagick – testováno na Windows 10 (32-bit) – XAMPP 5.6.15

1. Downloaded and installed latest ImageMagick: ImageMagick-7.0.2-0-Q16-x64-dll.exe
2. Downloaded php_imagick-3.4.3rc1-5.6-ts-vc11-x64 from <http://windows.php.net/downloads/pecl/releases/imagick/3.4.3rc1/>
3. Unpacked php_imagick.dll into [wampserver directory]\bin\php\php5.6.16\ext
4. Added extension=php_imagick.dll to [wampserver directory]\bin\apache\apache2.4.17\bin\php.ini
5. Got "no decode delegate for this image format" error, but at least imagick showed up in phpinfo() where I could see that php_imagick.dll was compiled with ImageMagick 6.9.3-7 Q16 x64. There was no obvious way to know this beforehand.
6. Downloaded ImageMagick-6.9.3-7-Q16-x64-dll.exe from <http://ftp.icm.edu.pl/packages/ImageMagick/binaries/> (ImageMagick has removed this package from their site).
7. Uninstalled ImageMagick-7.0.2-0-Q16-x64, installed ImageMagick-6.9.3-7-Q16-x64 to c:\ImageMagick, added c:\ImageMagick to PATH (in front, to avoid collision with windows convert.exe).

Verified everything ok with:

```
$image = new Imagick();  
$image->readImage([path to my jpeg]);  
  
$wm = new Imagick();  
$wm->readImage([path to my watermark png]);  
  
$image->compositeImage($wm, imagick::COMPOSITE_OVER, 5, 5);  
  
header("Content-Type: image/jpeg");  
echo $image;
```
